

Client Settings

Common Settings

Vault Locking

A screenshot of a settings interface for vault locking. It features a dark background with light-colored text. The first section is titled "Vault Timeout" and contains a dropdown menu currently set to "15 minutes". Below this is a descriptive text: "Choose when your vault will timeout and perform the selected action." The second section is titled "Vault Timeout Action" and contains two radio button options. The first option is "Lock", which is selected (indicated by a blue dot), and its description is "A locked vault requires that you re-enter your master password to access it again." The second option is "Log Out", which is not selected (indicated by a white dot), and its description is "A logged out vault requires that you re-authenticate to access it again."

Vault Timeout

15 minutes

Choose when your vault will timeout and perform the selected action.

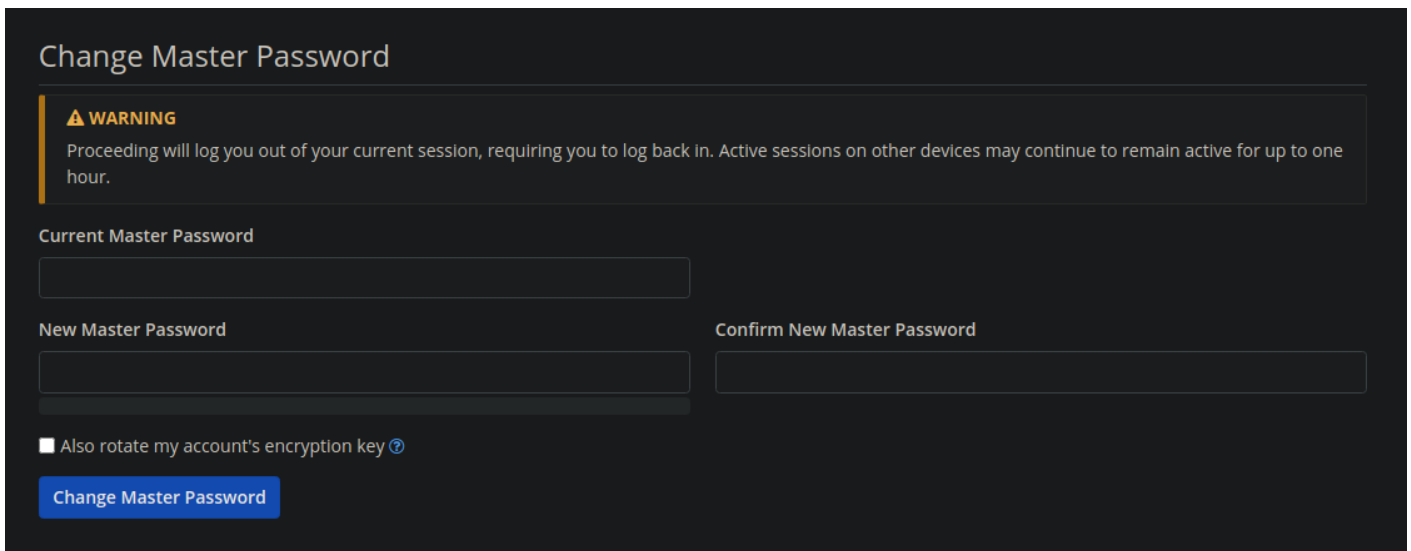

Vault Timeout Action

☒ **Lock**
A locked vault requires that you re-enter your master password to access it again.

☐ **Log Out**
A logged out vault requires that you re-authenticate to access it again.

There are two common settings - when to timeout, and what to do when it gets timed out. The above should be self-explanatory. The settings are different for the Browser Add-On which allows for the timeout to be the screenlock and/or a computer restart. The mobile app allows for an App Restart timeout.

Change Master Password

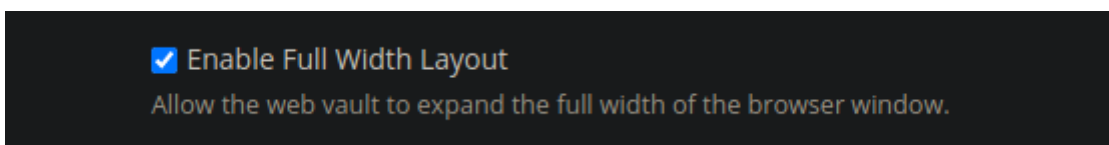

The screenshot shows the 'Change Master Password' page in a dark-themed web application. At the top, there is a warning box with a yellow triangle icon and the text: 'WARNING Proceeding will log you out of your current session, requiring you to log back in. Active sessions on other devices may continue to remain active for up to one hour.' Below the warning, there are three input fields: 'Current Master Password', 'New Master Password', and 'Confirm New Master Password'. A checkbox labeled 'Also rotate my account's encryption key' with a help icon is located below the 'New Master Password' field. At the bottom left, there is a blue button labeled 'Change Master Password'.

There are options on the other clients to do this, but they redirect to the web vault.

Web App

Display layout

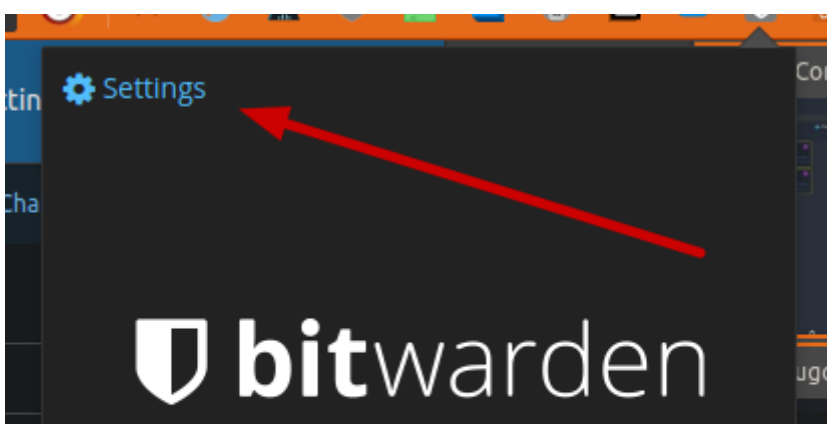

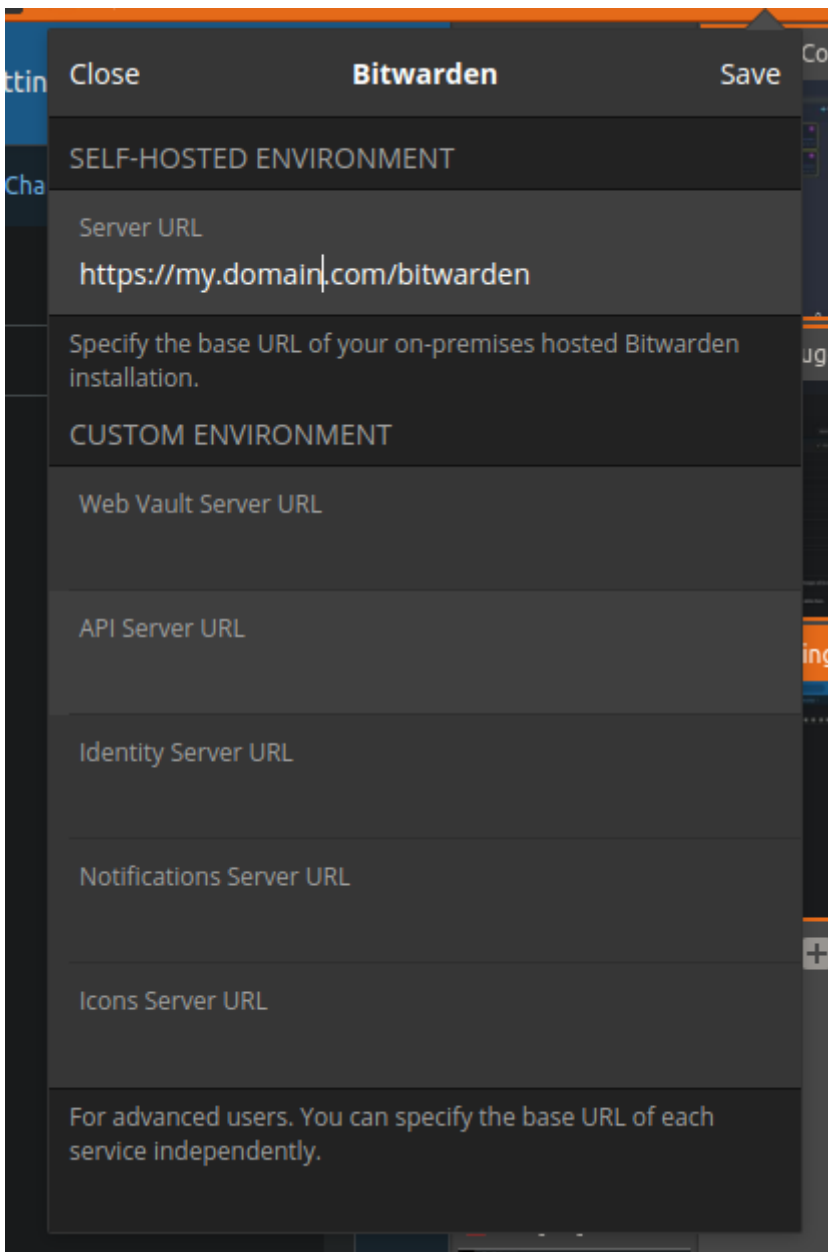

The screenshot shows a settings panel with a dark background. A checkbox labeled 'Enable Full Width Layout' is checked, with a blue checkmark icon. Below the checkbox, there is a descriptive text: 'Allow the web vault to expand the full width of the browser window.'

This allows the web vault to display using the whole width of your screen. Just a nice QOL improvement.

Browser Add-On & Mobile Client

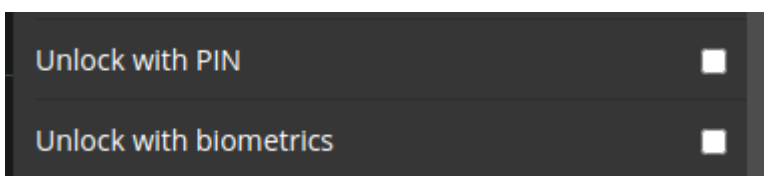

Server URL

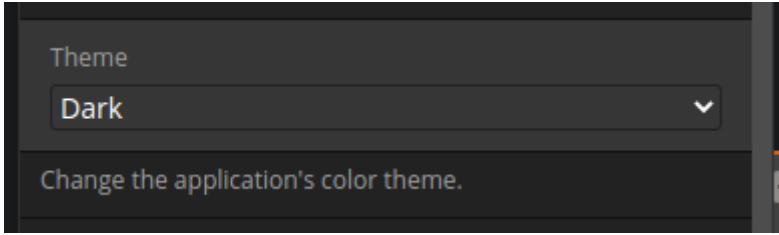

Your URL should include the `/bitwarden` path at the end of the domain.

Unlock with Biometrics/PIN Code

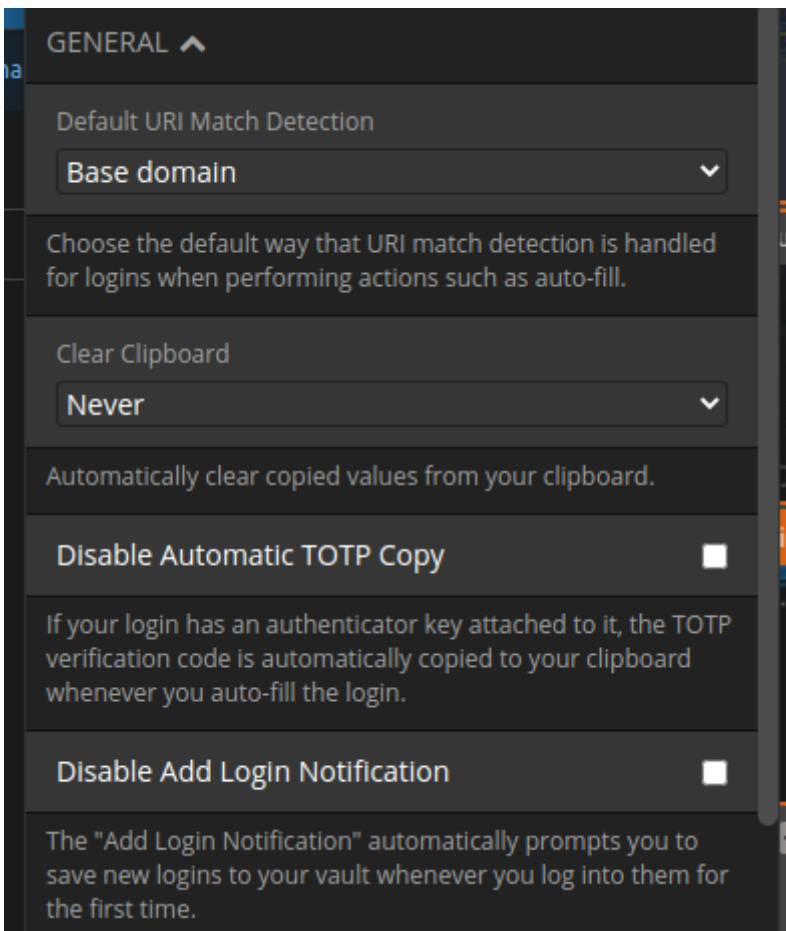

This allows you to log in using a PIN or biometrics (fingerprint reader on mobile, etc.). This is much more convenient after setting up a device than having to re-type your master password over and over again.

Dark Theme

The only sane choice.

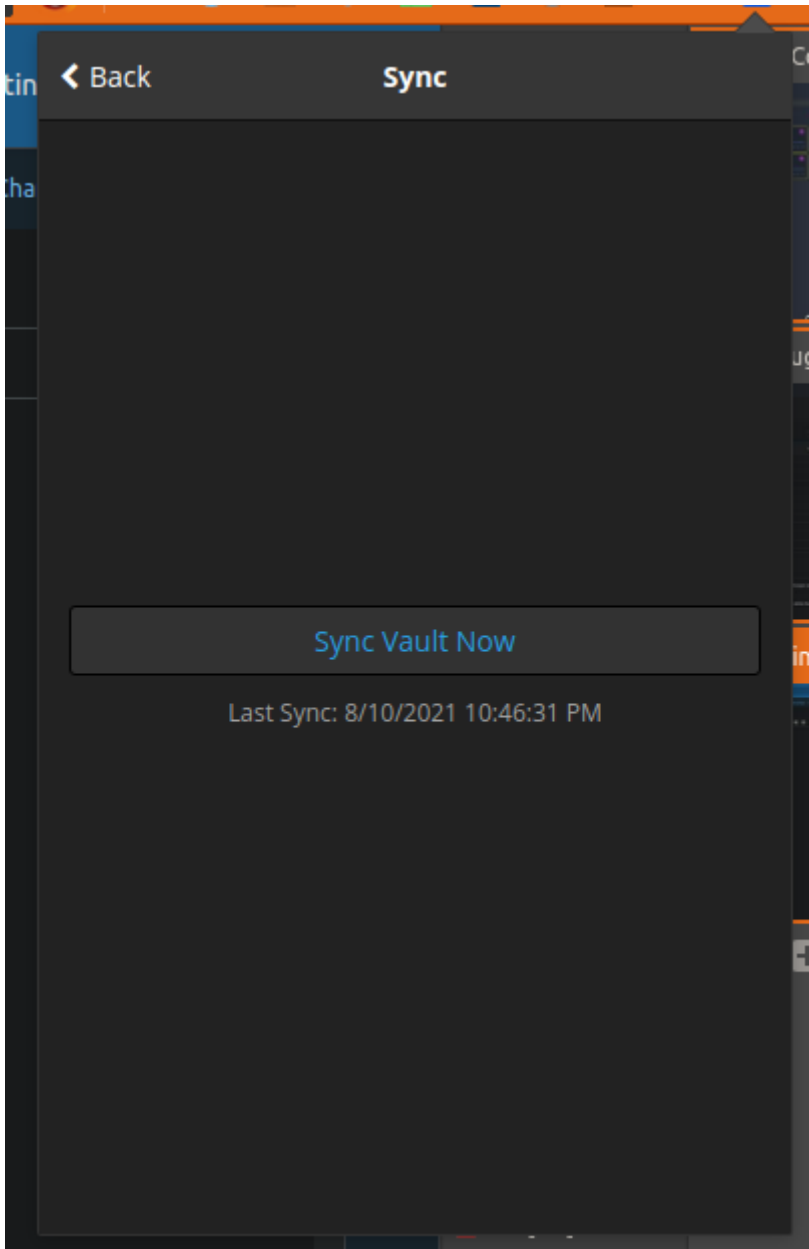

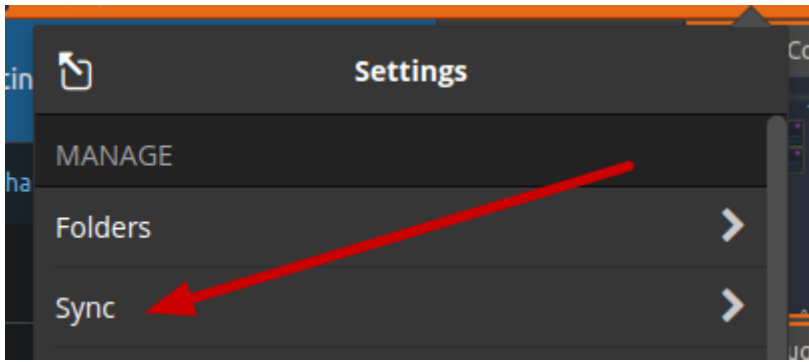

Auto-Fill

The explanations are above, but I would suggest setting these the way that seems best to you.

Note that if you don't have the URI saved for a site, but are using Bitwarden anyways, it will prompt you to add it to a new entry instead of the existing one.

Sync

This is to manually sync the clients. However, the clients sync any time there is a change as described in <https://bitwarden.com/blog/post/live-sync/>

Desktop Client

CLI
