

# Plugin Publishing

So from the Gitlab Releases, you can create a release.

First do this, and then zip the kanboard plugin from the CLI. Make sure it unpacks and creates a singular "CompletedComplexity" folder with the source underneath it.

Then upload that zipfile to the release "attachments".

This will give you a static URL to that zipfile. Copy that URL and replace the old URL in the kanboard website plugins page, along with the version. Then submit a PR to have the location for the new version updated.
